

Jobber for Cory — Approved Quote to Scheduled Job

For: Cory · **Date:** 2026-08-05 **Scope:** you own scheduling for **brand-new customers** — a quote gets approved, you turn it into a job that lands on the right day with the right tech.

Muhammad builds the client and sends the quote. Existing customers — next visit, reschedules, someone on file with nothing booked — stay with Muhammad off the address lookup. **New approved quotes are yours.**

Everything in here is measured off how the account is actually being built right now, including what's currently being built wrong.

Why this job exists

I audited the last 45 jobs created since the new territory grid went live on 2026-08-01:

What should happen	How often it does
Job recurs on the day we're actually in that zip	64%
Job assigned to the tech who owns that zip	80%
First visit marked (SET)	84%
New TMCP gets 5 weekly visits before going monthly	50%

The two weak ones are the two that cost money. A job recurring on the wrong day means a truck leaves its territory for one stop, or the visit gets dragged onto another day and the customer hears a date that doesn't happen. A TMCP customer who skips the weekly ramp goes straight to monthly visits while their moles are still active — which is not the program we sold them.

Getting those two right is the whole job.

The daily loop

1. Open **Quotes** → **Approved** in Jobber. These are customers who said yes and are waiting.
2. For each one: look up the route day and tech, then convert it to a job.
3. Check it against the address lookup.
4. Tell Muhammad it's booked so he can tell the customer if they call.

Step 1 — Look up the day and the tech

Before you touch the job, get the property ZIP and look up two things: which day we're in that area, and whose territory it is.

Use the address lookup: <https://claude.ai/code/artifact/20e073bc-db4d-4f9c-b49e-9adc55725fba>

Or the territory card at the end of this doc.

Don't go off the city name. 16 of the 78 cities we serve are split across different route days — Tacoma is on three of them. Bellevue is split between two techs on three different days. The ZIP is what decides, never the city.

Step 2 — Build the job

Convert the quote to a job in Jobber (**Convert to Job** on the approved quote). That carries the line items and pricing over. Then set the schedule — this is the part that matters.

Both products are **Recurring** jobs. Every Got Moles job is recurring; that's not what tells you which product it is. **The line item tells you the product.**

The Quick Fix

```
Job type:      Recurring
Recurrence:    Weekly on {the zip's route day}
Duration:      5 visits (start date -> 5 weeks later)
Tech:          the zip's tech
First visit:   title it "(SET)"
Last visit:    title it "(5th Visit)"
```

Five weekly visits, and that's the whole program. The Quick Fix is weekly by construction — activity codes and catches don't change it.

When the 5 weeks run out and there's still activity, that is a sales decision, not an automatic booking. Don't quietly add a sixth visit. Flag it — either we add one, or we sell them a TMCP or another month. That call goes to Spencer.

The Total Mole Control Program

```
Job type:      Recurring
Recurrence:    Monthly on the {nth} {the zip's route weekday}
Duration:      long-horizon (the account uses ~10 years)
Tech:          the zip's tech
First visit:   title it "(SET)"

THEN: add 5 WEEKLY visits at the front, before the monthly recurrence takes over.
```

The weekly ramp is the part that gets missed — half the time. TMCP promises weekly service visits until the property is under control, then monthly evaluations once activity stops. If you set up the monthly recurrence and stop, a customer who is paying for year-round control gets their second visit a month after their first, while the moles are still working.

A correctly built TMCP looks like this — this is a real one from the account:

```
Aug 6  Thu    <- SET
Aug 13 Thu    |
Aug 20 Thu    |   five weekly
Aug 27 Thu    |
Sep  4  Thu    <-
Oct  2  Thu    <- monthly from here
Nov  6  Thu
```

Setups are pinned — everything else floats

The first visit (the SET) **stays exactly where you put it**. It does not get pulled onto the route day by the route system. Every later visit does float onto the zip's day.

So: **book the SET on the zip's route day by default**. If you put a setup on a Tuesday in a Friday zip, a truck leaves its territory to service one property.

If the customer genuinely needs it sooner, that's fine — but check with Spencer before committing to an off-route setup, and don't promise the date on the call first.

What the nightly engine does — so you don't double-book

Since 2026-08-05 an automated job runs at **6:15pm daily**. It reads the day's visit notes and **books the follow-up visits itself**, based on what the tech actually found:

What the tech found	What the engine books
Caught a mole — any product	Next visit ~1 week
TMCP with any activity	Next visit ~1 week
TMCP genuinely quiet (N/A , no catch, no miss)	Monthly
Quick Fix, mid-series	Weekly — it's weekly by construction
Quick Fix, 5 weeks done, still active	A task, not a visit — sales decision

"Activity" is binary — there is no light-vs-heavy ladder. It's activity if there's fresh sign, **or** a catch, **or** a miss. A trap that was hit but didn't hold means a mole was working that run and got away, so the property is not quiet. Going the other way: **old mounds are not activity** — dried, crusted, grass growing through means moles *were* there. A yard covered in old sign can still be a true **N/A** .

So the ongoing cadence is not your job. The initial build is. You set up the job correctly and the engine keeps it correct from there.

Two things follow from that:

- **Don't hand-add follow-up visits** to a job that's already running. The engine will add one too, and the customer gets two trucks or a duplicate that someone has to delete.
- **The engine will not touch a SET**. It's specifically guarded against rescheduling setups — which means a setup you place wrong stays wrong until a human fixes it. Get the SET right.

It's also capped at 25 writes a day and aborts rather than exceed it, so if a big backlog builds up it stops instead of flooding the calendar. If you see it abort, tell Spencer.

Step 3 — Check the tech is real

⚠ Never assign a tech who isn't in the field

Not working: Spencer Hill (permanently out of field since 2026-07-29), Tavis Alexander, Robert Norton (rides along, never his own truck).

In the field: Alias Franks, Cory Ventura, Cammeron Anderson, Luke LaVergne.

This is already a live problem. As of today there are **68 upcoming visits across 24 jobs still assigned to Spencer Hill**, starting August 17. Nobody is going to those. They look scheduled in Jobber and no truck is routed to them.

Your first cleanup task — reassign these to the tech who owns the ZIP:

Job	Customer	City / ZIP	Upcoming	Next
#8298	Melinda Holland	Redmond 98052	3	Aug 17
#8275	Damien Romanik	Issaquah 98029	3	Aug 20
#8270	Brian Meadows	Renton 98058	9	Sep 4
#8267	Matt Kirk	Tacoma 98499	2	Aug 21
#8266	Darren Mccullough	Ravensdale 98051	2	Aug 21
#8258	Ken Larson	Fall City 98024	9	Aug 21
#8250	Donna Youngblood	Bellevue 98006	2	Aug 20
#8249	John Shepard	Sammamish 98074	1	Aug 19
#8244	Nora Beckman	Gig Harbor 98335	9	Aug 18
#8243	Jody Sanders	Maple Valley 98038	2	Aug 20
#8242	Troy Deimarly	Federal Way 98023	2	Aug 17
#8241	Tang, Zhaohui	Bellevue 98006	2	Aug 20
#8240	Joyce Moen	Bellevue 98006	2	Aug 20
#8229	Mary Yu	Lacey 98516	2	Aug 17
#8228	Matt Vega	Kent 98042	1	Aug 21
#8226	Cliff Weiss	Bellevue 98006	1	Aug 21
#8224	Kelsey Peck	North Bend 98045	9	Aug 28
#8223	Anastasia Piakarskaya	North Bend 98045	1	Aug 21
#8220	Lily Tsai	Newcastle 98059	1	Aug 20
#8208	Jakob Laroche	Graham 98338	1	Aug 18
#8207	Amy Tang	Newcastle 98056	1	Aug 20
#8206	Aaron Rutledge	Gig Harbor 98332	1	Aug 18
#8205	Jake Fox	Graham 98338	1	Aug 18
#8204	Michael Marquez	Maple Valley 98038	1	Aug 22

Scanned across jobs #8201–#8325. There may be more further back — worth a full sweep once these are clear.

Careful in Jobber: editing a visit's assigned users **replaces** them, it doesn't add. And there's no job-level reassign that fixes existing visits — changing the job's default tech does not move visits already on the calendar. You have to touch the visits.

Step 4 — Verify before you move on

1. **Right day?** Recurrence weekday = the zip's route day.

- 2. **Right tech?** Matches the zip, and they're actually working.
- 3. **SET on the route day?** Unless Spencer approved an exception.
- 4. **TMCP — are the 5 weekly visits there?** Look at the visit list, don't assume.
- 5. **Check the address lookup tomorrow.** It rebuilds at 6:45am, so something you book at 10am shows up the next morning. If it comes back red — "not on the planned route" or "the two systems disagree" — the job is booked but no truck is going to it.

Visit times are placeholders. The times on visits are not real appointment times and arrival windows are handled separately. Don't quote a time off a visit.

Capacity

Target is **40 hours a week per tech, 42 is the ceiling**. If a day is already full, don't just stack another stop on it — an overflowed day means someone gets pushed, and the customer who gets pushed is usually the one who was booked correctly.

Overflow rule: one job, and only if it's within about a 15-minute detour of the route.

If a day is genuinely over, that's an escalation, not a judgment call you make alone.

Escalate, don't guess

- The 5 weeks of a Quick Fix are used up and there's still activity → **sales decision**
- A customer wants a setup off the route day → **Spencer**
- A route day is over capacity → **Spencer**
- A ZIP that isn't in the grid at all → **Spencer** (there's at least one)
- Commercial or over-5-acre bids → **that's your other job** — in-person, you own it
- The lookup shows red on something you booked → **Spencer**, same day

Territory card

Grid v5, effective 2026-08-01. Ask before working from an older copy.

Alias Franks — north (Seattle north, Eastside, Snoqualmie Valley)

Day	Area
Mon	Bellevue, Kirkland, Medina
Tue	Seattle, Shoreline
Wed	Bothell, Carnation, Duvall, Kenmore, Woodinville, Monroe, Snohomish
Thu	Redmond, Sammamish
Fri	Fall City, Issaquah, North Bend, Snoqualmie

Cory Ventura — south King

Day	Area
Mon	Federal Way, Pacific, Burien, Normandy Park, Milton, Tacoma
Tue	Seattle, SeaTac
Wed	Kent, Renton
Thu	Bellevue, Mercer Island
Fri	Bellevue, Renton

Cammeron Anderson — south, east half

Day	Area
Mon	Auburn, Edgewood, Sumner
Tue	Black Diamond, Enumclaw, Ravensdale
Wed	Buckley, South Prairie, Wilkeson
Thu	Orting, Bonney Lake
Fri	Maple Valley, Kent

Luke LaVergne — south, west half (I-5 Tacoma, Puyallup, Thurston, peninsula)

Day	Area
Mon	DuPont, Steilacoom, Tacoma, Olympia
Tue	Puyallup, Edgewood, Tacoma, Fife
Wed	Bremerton, Gig Harbor, Fox Island, Port Orchard, Olalla, Vaughn, Tacoma, Fircrest, University Place
Thu	Olympia, Tenino
Fri	Eatonville, Graham, Roy, Yelm

*Cities appear under more than one tech — Bellevue, Tacoma, Kent and Auburn are all split. **Always resolve by ZIP, never by city name.***

The card

Look up the ZIP → get day + tech · Quick Fix = weekly ×5 · TMCP = 5 weekly THEN monthly · SET is pinned, book it on the route day · Never assign Spencer, Tavis or Robert · Check the lookup the next morning

You build the job. The 6:15pm engine keeps the cadence. Don't hand-add follow-ups.
