# Editing Your Slides with Canva Magic Layers

How to make quick edits to your AI-generated slides  
without re-running the skillpack

*canva.com · Magic Layers shortcut on the home screen*

canva.com → Magic Layers

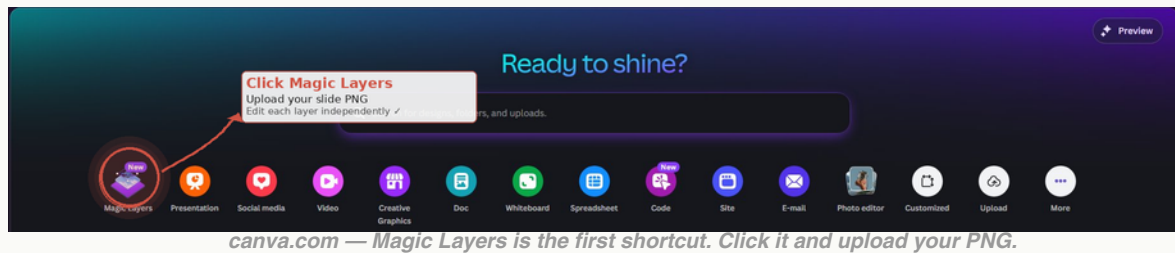

# What is Magic Layers?

Canva's AI feature that takes a flat **PNG or JPEG** and separates it into independent, editable elements — text boxes, objects, shapes, background. No rebuilding from scratch.

**Where are your slides?** After running the skill pack, open the preview:

`projects/00-social-content/[date-title]/preview/index.html`

Inside the preview, click **Download** on any slide to save the PNG — then upload directly to Canva.

## Step-by-Step

### 1 Go to [canva.com](https://canva.com) → click Magic Layers

- Open **canva.com** and sign in.
- Find **Magic Layers** in the shortcuts row (first icon, marked **New**).
- Or type 'Magic Layers' in the Canva search bar.

### 2 Upload your generated slide PNG

- Click **Select Media** (or drag-and-drop).
- Upload the PNG from your preview download folder.
- PNG only — all skill pack outputs are PNG, you're set.

■ Upload one slide at a time.

### 3 Wait for AI processing (~15 seconds)

- Canva analyses the image and unlocks each element.
- Once done, the design opens in the editor with all layers separated.

✓ **TEMPLATE** slides (clean layouts) give the cleanest results. AI-generated scene images come through as a single replaceable layer.

### 4 Open Position → Layers tab

- Click any element on the canvas.
- Click **Position** in the top toolbar → select the **Layers** tab.
- All detected layers are listed: title text, body text, shapes, background.
- **Click any layer name** to select and edit it independently.

✓ Drag layer names to reorder depth. If text is hidden behind a shape, move it above.

### 5 Edit and export

- **Text:** double-click → change copy, font, size, color.
- **Objects:** select layer → color picker in top toolbar.
- **Delete:** select layer → Backspace.
- **Export:** Share → Download → PNG.

■ Magic Layers may substitute fonts not available in Canva — reassign your brand font if needed.

## Quality Expectations

---

|                                       |                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| ✓ <b>TEMPLATE slides</b>              | Pure HTML/CSS template — clean layout, distinct text zones. Separates almost perfectly. All text boxes and shapes come through as individual layers. |
| ~ <b>HYBRID_AI / FROM_REAL slides</b> | Template chrome layers separate cleanly. The composited AI image or headshot comes through as a single image layer — replace it as a block.          |
| ✗ <b>Complex AI scenes</b>            | Heavy texture or painterly images may pixelate or merge. In these cases re-generate the slide from the skill pack with adjusted parameters.          |

### Edit or re-generate?

Use **Magic Layers** for: typo fix, color swap, font adjustment, minor repositioning.  
Use **/00-social-content** for: new hook, different arc, concept change, full redo.
