

The Three Moves — Muhammad's Training Sheet

For Muhammad - the three moves, graded

For: Muhammad · **From:** Spencer · **Date:** 2026-08-04 **Based on:** your first role-play call (2026-08-04, Enumclaw new homeowner) and 205 recorded Got Moles calls from the last month.

Read this part first

There are three ideas that close Got Moles deals. Not three facts you sprinkle in when someone asks — **one argument, in three moves, that you say out loud before you ever mention a price.**

Here it is in one breath:

Your yard is the food source → the tunnel is a **net** that catches the food → when the net stops producing, they dig new tunnel and that's your new hills → moles are **territorial**, so when we catch this one, another one moves into the empty territory → so it's **not if they come back, it's when and how often** → which is why there are two ways to do this.

That takes about 60 seconds to say. Sixty seconds.

Why it matters: when you say this first, the price is the *answer* to a problem the customer now understands, and you never have to defend it. When you say the price first, you're just a guy reading a price list, and the customer has to decide based on the number alone. On your call you did it the second way — and a customer who was ready for the year-round program bought the one-month instead.

Spencer talked for nearly two solid minutes on a call this morning. He even stopped and said "*I know, I got to take a drink after all of that, that was a lot of talk.*" The customer signed up for the annual program.

Your call, graded on the three moves: 15/30. Here's each one.

MOVE 1 — The tunnel is a net to catch worms

What it does

It answers "why is this happening to *me*?" It makes the customer feel understood instead of unlucky. It also explains why the hills appeared *this month*, which is the thing they're actually upset about.

Say this

"Moles eat worms — they have to eat about **70% of their body weight every single day** just to stay alive. And the way their tunnel system works is **like a net to catch their food**. The worms fall into the tunnel, the mole comes along and eats them.

This time of year everything around you is drying out, so your watered lawn is where all the worms are — **you've basically rung the dinner bell**. And when a tunnel stops producing enough worms, the mole has to dig new tunnel to catch more. **That dirt has to go somewhere — and that's the new hills you're seeing.**"

Your grade on Move 1: 4/10

You got the food half right, and you got it in your own words, which was good:

"When you really take care of your lawn properly, your landscape properly, there are worms in it. And the worms are their best food."

That's correct and the customer accepted it. But you never said the net, never said 70%, and never explained **why new hills appear** — which is the whole reason they called.

Where you lost it

The customer handed you the opening on a plate:

Customer: *"So, like, they have, like, a main tunnel system that they're using. You're going to find that."*

That is a customer **asking you to sell him**. You answered:

You: *"Yeah, yeah, it's like hundreds of miles."*

Two problems. One, it isn't true — and a customer repeats numbers like that to his neighbor. Two, you had the perfect answer available and used a guess instead. Here's what Spencer said to almost the same question this morning:

*"They want to take the easy path — if they don't have to make a new tunnel, they don't. They only start digging new tunnels when they're not getting enough food. If they are getting enough food, they just keep running the same tunnels over and over again — **which is how we catch the moles**. We don't use baits, chemicals, poisons, nothing. We're just using the patterning of what we know the moles do."*

Fifteen seconds, and it proves you know your job.

Rule: never guess a mole fact. "I don't know, I'll get that answer from Spencer" scores better than a confident wrong answer. Every time.

The bonus line — for "won't they be gone in winter?"

*"They don't go away — we just stop seeing them. When it's raining everywhere, the tunnels they already have produce enough worms, so they don't need to dig new ones, so you don't get new hills. **It's a visibility thing**. We catch moles year round on around a thousand properties."*

MOVE 2 — Moles are territorial

What it does

This is the move that turns a one-month customer into a year-round customer. It answers two questions at once: *"how many moles do I have?"* and *"why will they come back?"*

Say this

"Most of the time they're loners — they're **territorial**. So in most cases it's **one or two moles causing all of that damage**, not a hundred.

But that's also the catch. **Because they hold territory, when we catch this one, another mole moves in to take it over.** The tunnels are already dug and your yard is still full of worms — so it's a free-for-all for the next one. **That's basically what this whole thing is about.**"

Your grade on Move 2: 5/10

You said the word and you got the best part of it right:

"They are actually territorial. So it looks like that you have probably hundred of them, but you probably have just one or two."

That's exactly right and it's a genuinely reassuring thing to hear. Well done.

But then you stopped. You said *"they are going to come back"* without ever connecting it to being territorial. **Territorial is the reason they come back** — you left the two halves sitting next to each other without joining them.

The half you missed

"Once I catch those moles, **it's a free-for-all for the next mole to come along and take those tunnels** — which they will, because you've got the food source. And there is really no way that I've ever found to get rid of worms. And you don't want to get rid of worms." — Spencer, 2026-07-27

The bonus line — for "will this ever end?"

"A female mole has six to nine young every year. If nobody in your area has been trapping, that population has been compounding for years. Once we put a serious dent in it, it takes longer and longer for the next one to show up and take over the territory."

MOVE 3 — It's not *if* they come back, it's *when and how often*

What it does

This is the pivot. It's the sentence that turns "two prices" into "an obvious choice." It has to be delivered as **honest bad news**, not as a sales line — that's exactly why it works.

Say this

"The thing with moles is **there's no such thing as one-and-done mole control**. It's really **not a question of if the moles are coming back — it's when, and how often**. Sometimes that's one month, sometimes it's a year. It depends on your yard. So there are two ways to go about this."

→ and *that* is where the prices go. Move 3 is the bridge into the pitch. It is not a fact you mention in passing.

Your grade on Move 3: 6/10

You actually said it, in your own words, and it was correct:

"They are going to come back. It's just a matter of time, right, because there are going to be tunnels under it and some more is going to find it and they're going to come back."

Good. That's the idea, delivered right. The problem is **where** you said it — buried in the middle of an answer, *four minutes after you'd already quoted both prices*. By then the customer was doing math, not listening to reasoning.

Where it cost you the sale

Late in the call the customer said:

Customer: *"I'm going to sign up for the one month, and then we'll see how you guys do. If you guys actually catch the moles, then maybe I'll sign up for the year."*

You said *"That sounds good."* That's a fine answer — but that objection has a real reply, and it's Move 3:

"Totally fair, and honestly a lot of people start there. The one thing I'd say is that the one-month tells you we can catch them — it doesn't stop the next one moving in, because that territory opens right back up. That's not a maybe, that's just what moles do. So if it comes back in six weeks, you'd be calling us again at \$450. **Four calls a year is \$1,800. The program is \$1,200 and we never leave.**"

Say it once, then take whatever he chooses. **You never argue — you just make sure he decided with the full picture.**

The honesty close (memorize this one)

"The reason I built that out is because most do come back. I can almost guarantee it. I had so many people calling me four or five times a year at \$450 that staying out there year round was just more cost effective — and we had more success." — Spencer, 2026-07-27

And Spencer's proof line, which is the strongest thing you can say:

"I trap the moles in my own yard this way. **The traps never leave the ground at my house.** I'm terrible about checking them — I'll go out weeks later and there'll be moles in the traps before I even knew I had one."

The rest of your call

You'll get the full breakdown separately, but the short version: **63/100, capped to 60** because of the "hundreds of miles" guess.

What was genuinely good — don't change any of it:

- **Your tone.** Warm, patient, not pushy, and you didn't get defensive when he pushed back on price. That's the hardest part of this job and you already have it.
- **Your answer to "\$100 a month sounds expensive."** *"If you call us three times a year, it costs you more than what you'd be paying for the plan."* That's the right answer and you found it yourself.
- **Your explanation of what happens next.** Quote → approve → text with the ETA → text when we're on the way. Clear and reassuring. Keep it word for word.
- **The \$150 credit bridge.** You used it twice and it's exactly right.

Three things to fix:

1. **Ask "how long have you been dealing with the moles?" before any price.** You asked it *after*, as a stall. That question decides which option you recommend. This customer had just bought the house and had no idea — which is the textbook answer for recommending the quick fix as a benchmark. You could have looked like an expert there.
2. **Ask the capture questions one at a time and wait.** You listed all four fields and then only got a first name. No email, no address, no phone. And you never asked **"how did you find us?"** — always ask it. (Right now it's telling Spencer that ChatGPT is sending customers.)
3. **Don't promise a day you haven't checked.** You said "we'll see you today or tomorrow." Spencer's version is *"I want to say Thursday, but let me make sure"* — then he actually looks. Use the address lookup before you name a day.

Your drill before the next call

Say the three moves out loud, in order, ten times. No notes by the tenth.

1. **Net:** worms → 70% of body weight daily → tunnel is a net → dry summer + your watered lawn = dinner bell → tunnel stops producing → new tunnel → **new hills.**
2. **Territorial:** one or two moles, not a hundred → but they hold territory → we catch this one → **the next one moves into the empty territory.**
3. **Pivot:** no one-and-done → **not if, but when and how often** → *"so there are two ways to go about this"* → **prices.**

The one rule for your next role-play: no number comes out of your mouth until all three moves are done and you've asked how long they've been dealing with moles.

Do that and everything else on the call gets easier.
